

# David Wu

Boston MA - [wu.dav@northeastern.edu](mailto:wu.dav@northeastern.edu) - 978-493-3141 - [github.com/DavideoWu](https://github.com/DavideoWu) -  
<https://www.linkedin.com/in/david-wu-70094b272/> - Available June to December 2026

## Education

Northeastern University, Boston, MA

*Expected May 2027*

- Candidate for a Bachelor of Science in Computer Science, AI concentration
- **Relevant Coursework:** Fundamentals of Computer Science I and II, Artificial Intelligence, Object Oriented Design, Algorithms & Data, Machine Learning and Data Mining I and II, Natural Language Processing

## Work Experience

C the Signs, Inc.

Cambridge, MA

AI Engineer Intern (Remote)

*May 2025 - August 2025*

- Worked at an early-stage healthcare startup to **independently** design and deliver an **agentic AI project** that explores the technical feasibility of generative AI in cancer risk prediction.
- Achieved **98% cancer risk prediction accuracy** by building a **Langchain RAG-based** evaluation agent on UK NG12 guidelines.
- Built a **natural-language** patient query agent using **Llamaindex** to search patients with specific symptoms using **semantic search** on a vectorized patient record dataset.

## Projects

AI Text Detector | LSTM, Tensorflow, GloVe, Python, Numpy, Matplotlib

*January 2026*

- Converted HC3 and Turing-Bench datasets into **TF-IDF, n-grams, and GloVe features**, containing over 200,000+ samples combined for **natural language processing** purposes.
- **Built and evaluated** logistic regression, SVM, CNN, RNN, LSTM, and fine-tuned DistilRoBERTa — to **classify human vs. AI-generated text**.
- Demonstrated **effectiveness of LSTM model** in AI text classification by training on GloVe-feature samples and obtaining a **97.23% testing accuracy**.

NFL Recommender System | Python, Pandas, Numpy, TensorFlow

*December 2025*

- **Preprocessed** an NFL fan survey dataset (513 → 28 features) using one-hot encoding, label encoding, and feature aggregation to isolate the most predictive fan preference signals.
- Built a **multilayer perceptron** in **TensorFlow** to recommend NFL teams to new fans, tuning architecture depth to address class imbalance across 32 unevenly distributed team labels.
- Evaluated model performance on **held-out test data**, achieving 0.68 accuracy and 0.51 recall; identified precision limitations (0.48) from class imbalance as an area for future improvement.

FDA Regulatory Co-pilot | Multiagent Generative AI, Python, Langgraph, Claude

*May 2026*

- Built a **LangGraph**-based multi-agent system that **automatically** analyzes FDA regulatory, safety, and adverse-event data to **generate drug research reports**.
- Developed a **validator agent** that independently retrieves evidence and flags contradictions or unsupported claims produced by research agents, **improving output reliability**.
- Reduces manual research effort by generating drug safety summaries in **under 2.4 seconds**.
- **Presented** the project to a hackathon panel, placing **7th** out of 80 teams.

## Technical Skills

**Programming Language:** Java, Python, C, Kotlin, SQL, Typescript

**Web Technologies:** HTML, CSS, JavaScript, React,

**Tools:** Github, VSCode, Jupyter Notebook, IntelliJ IDEA, Linux, JUnit, Docker, MySQL, MongoDB

**Machine Learning:** Scikit-learn, NLTK, Numpy, Matplotlib, Pandas, Tensorflow, Deep neural networks, Natural language processing

**AI:** Retrieval Augmented Generation, LangChain, LlamaIndex, OpenAI LLM fine-tuning, Google ADK, Claude Code
